```

1.1.1 Sleep study data

- Dataset included in lme4 in R and MixedModels in Julia

- 18 participants restricted to 3 hours of sleep every night for 9 nights
- DV: average reaction time speed
- http://lme4.r-forge.r-project.org/slides/2011-01-11-Madison/2Longitudinal.pdf

1.1.2 LMMs

- linear mixed effects models, add to linear regression the ability to account for random variance in repeated-measures designs (i.e., same participants or same items)
- lme4 package in R well-used in psychology, cognitive science, linguistics, etc.
- lme4 models often fail to converge in R, requiring simplified model specification
- takes a long time even when it does converge

[2]:
```
sleep = DataFrame(MixedModels.dataset(:sleepstudy));

names(sleep)
```

[2]:

```

Things to look out for: - missing values may be treated differently - easy solution: remove NAs in R in advance - changes in packages, especially ``younger'' ones - may have to be creative with package management - may be less on Stack Overflow
